Question What are the best ways (or tips) to: make shorter codes? encourage the compiler to do that for you? I've tried these methods but none of them worked: Use concise and idiomatic Swift Avoid bridged types (e.g. I have a view, an array of view, and a set of items to be added to the array of views) Strip all the legacy code - leave only the relevant parts (e.g. 4+ views - just use an array) Conform to Cocoa naming (e.g. URL in interface) Background I'm currently programming in a small team of people using Xcode 8.2 and Swift 3.2. I want to be more concise, as concise as possible, and I encourage the team to also. I also want to be able to deal with future changes in swift without having to go back and change all of the code. The process of maintaining a code is time consuming and tedious for some members of the team. Question What is the best way to do that? A: Do you have a way to jump to definition in your editor? If so, perhaps you can find other idiomatic ways to write your code. If you can't jump to definition, and your editor doesn't have

But recently, scientists have begun looking at the Antarctic ice, what's known as the East Antarctic ice sheet, and they're finding a very different story. Now the east Antarctic ice sheet is the thickest and most massive ice sheet on the planet. It may hold 30 times as much water as the entire Northern Hemisphere. And these are these giant ice shelves. These are enormous glaciers that basically extend from the edges of the continent down onto the seabed. And the idea that these ice shelves would melt away and lead to a rise in sea level was a major concern for a long time. But since the 1990s, there's been an alarming rise in the temperature in the Antarctic. And as it is melting at a very rapid rate. This has caused a new theory to surface. Previously we talked about the four causes of sea level rise. The first being the thermal expansion of the oceans. The second would be the melting of glaciers on land. The third would be the melting of ice caps and the fourth would be the huge amount of water that the ice sheets would store. The problem is that the water that's stored in the ice sheets is millions of years old. And when it gets heated up, the ocean and land releases that water into the atmosphere. And these amounts of water entering the atmosphere have the effect of canceling out some of the effects of the thermal expansion. This is why nobody's worried about sea level rise anymore and why the IPCC has downplayed its gravity. But if there is still the effect of thermal expansion, the melting of ice sheets has less effect on the volume of water stored in the ice sheets. And now there is a new problem for scientists to ponder. Over the years, the East Antarctic ice has been growing. And during this period of growth, it's grown at a pace that's 0cc13bf012
