Abstract The effects of cyanamide on plasma noradrenaline (NA) and its metabolites were examined in man during graded exercise to exhaustion on a bicycle ergometer. Exercise resulted in a significant increase in plasma NA. In contrast, no increase was detected in the concentrations of the principal NA metabolite, normetanephrine (NM), in either the resting or exercising state. In the resting state, cyanamide (up to 4 g/day for five days) produced a dose-dependent fall in plasma NA and NM concentrations, the highest dose producing a approximately 75% reduction of each metabolite. During exercise, cyanamide did not change NM or NA plasma concentrations. However, at high doses of cyanamide there was a rise in NM concentration. The data indicate that cyanamide may block the metabolism of NA to NM but not its entry into the circulation. The present invention relates to a semiconductor device and a method of manufacturing the same and, more particularly, to a device isolation technique. In general, a device isolation structure in a semiconductor device is used for ensuring isolation between an active region and a peripheral circuit region and preventing cross talk between the regions. In various semiconductor devices, it is typical to provide a field oxide layer as a device isolation structure by locally oxidizing a semiconductor substrate. However, c6a93da74d
