AutoCAD is used for most types of architectural, mechanical, and civil engineering drafting, including plan, elevation, section, detail, and parts drawings. Most architectural and civil engineering firms use AutoCAD as their primary CAD application. AutoCAD is also the most popular CAD package used by architects, and it is often used by industrial designers, civil engineers, and mechanical engineers. Autodesk has also used AutoCAD to produce other sorts of drawings, such as legal drawings, budget plan sheets, architectural plans, house plans, architectural blueprints, etc. As of August 2014, Autodesk reported that AutoCAD used by a few million users and businesses throughout the world and, as of October 2014, the company said the AutoCAD software was used by more than 70,000 firms and 700,000 users worldwide. History AutoCAD was created by Autodesk in 1982, as a technical spin-off from their previous work on AutoCAD-1, their first commercial CAD application. Other early customers for AutoCAD included the National Center for Atmospheric Research (NCAR), NASA, and Texas Instruments. AutoCAD-2 was released in 1983 and, by the end of 1985, it was used at more than 300,000 sites worldwide. AutoCAD-3 was released in 1986, when AutoCAD became available to the public. The 1986 earthquake in Mexico City, where the Autodesk campus was located, caused a power outage. This was followed by several days of monsoon rains which flooded the AutoCAD campus. After an unsuccessful attempt to run AutoCAD-3 on a portable black-and-white television, Autodesk programmers Steve Cooper, Bob Fisher, and Ed Simpier had an idea: they would use the black-and-white television to show the user a three-dimensional wireframe representation of their drawing while they were working on it. This idea formed the basis of the now-famous command View Draw or simply View, which has been in AutoCAD since version 4, and is used to view 3D objects on any 2D surface. View was also the first AutoCAD command to use colors to represent different layers of the model. Features Like all Autodesk products, AutoCAD supports and is compatible with both the Windows and Mac OS. There are many features and tools that make AutoCAD unique, and allow users to do things in a way

Programming in AutoCAD is supported by a variety of different programming languages, from simple AutoLISP to C++, Java and Visual Basic. AutoLISP is the original programming language in AutoCAD, but it has been superseded by more modern languages. AutoCAD's data types are similar to those of Microsoft Excel, with additional data types for geometry. AutoCAD uses a Pascal-like syntax. New AutoLISP users are often confused by the difference between the original AutoLISP syntax, and the newer, standards-based AutoLISP syntax. The former is almost completely obsolete, while the latter has largely replaced it. AutoCAD users who still use the original language are often still referred to as "AutoLISP users" or "LISPers", while new users may be referred to as "non-LISPers". AutoLISP uses its own data types and function libraries. AutoLISP The original AutoLISP language is still available. AutoLISP is rarely used for new development today, but many users remain unaware that AutoLISP has been replaced by modern, standards-based languages. For details, see AutoLISP. AutoLISP was developed by Al Basile, who also designed the first LISP interpreter, and was a member of the LISP language team. It was named after the AutoCAD's first graphical user interface, AutoLISP. In AutoLISP, a variable of type X is equal to the X-th element of a list. List has a function named "partition" (in AutoLISP). For example, the first two elements of the list returned by partition(["foo","bar","foobar"]) is "foo" and "bar". If a list is empty, there is no error. If the list has more than one element, the error "list has more than one element" is reported. A comma-separated list can be split into multiple lists. This is done with the function splitter. For example, (splitter(["cat,dog,mouse,rat"], 2)) returns ["cat","dog"]. All functions of a language are defined in a package. For example, the package that contains the function splitter also contains the function 'wordexp'. The symbol 'and' is an operator in a1d647c40b
