A fast and powerful web app for designing and editing vector sequences in One Vector Editor. Create a sequence of nucleotides with a start and end marker. Identify an area of the sequence that you want to be transcribed as an mRNA and one that you want to be transcribed as a non-coding RNA. Set up cut sites, translate your nucleotide sequence, check gene coordinates, and change your sequence scale. Generate a sequence as a Genbank file. Paste a sequence from Genbank into an editable sequence. Import and export sequences in the FASTA format. Create a sequence for each ORF in your sequence using Vectro ORF tool. Produce non-coding RNA oligo using the OVE OneRNA tool. Enter any nucleotide sequence into the editable sequence and include the secondary structure. Show features in a sequence such as start and end Markers, Polyadenylation sites, Introns, Exons, Genes, and ORFs. Use the ORF tab to view ORFs. Optimize your sequence with the OVE ProOFTool. Check the sequence to determine if it contains any problematic nucleotides. Manage your sequences, check their coordinates, and check your sequence data. This editing mode allows users to create a sequence for their own use, perhaps for gene or protein design purposes or simply to test their own editing skills. The app is meant for those who have extensive editing experience. We would advise users to select the Basic editing mode as a starting point, and then decide whether they want to switch to the Advanced editing mode if they discover an error in their sequence. Otherwise, users will have to reload the sequence in the same editing mode each time they want to try again.
