Incredibly powerful, Photoshop has its down sides, too. You need to pay for it, and even Photoshop Elements costs money. Although, in the case of Elements, you can get a free trial. In this chapter, we examine how to use the basic tools and functions of Photoshop to create, manipulate, and embellish your images. Taking a gander at the basic tools of Photoshop As you get into using Photoshop, you notice certain tools tend to remain in the same places on the screen, and you use them almost all the time. The six most important tools (five other tools don't really belong in this chapter) to know are Align tools: The first tool in the tools palette is Align, which contains two tools: Align Left and Align Middle. Use the Align Left tool to rotate an object so that it's aligned with the left side of the canvas. Use Align Middle to align it in the middle. The Align Right tool is used to align to the right. Figure 9-1 shows you how to use these tools to align an object. See Chapter 5 for more on aligning objects. Blur tools: The first tool in the Blur tool group is the Blur tool, which offers three different types of blurs: Gaussian Blur, Motion Blur, and Sharpen, which will sharpen the overall image. Dodge and Burn tools: The Dodge tool replaces the image area with colors that have a neutral tone value. The Burn tool can do the opposite — it replaces the area with colors that have a high tone value. You can use the Dodge tool to lighten an area, or you can use the Burn tool to darken an area. See the upcoming section "Dodging and burning: The Dodge and Burn tools" for details on how to use these two tools. Gradient tools: The Gradient tool offers three types of fills that can be used in any selected area of the image: Gradient, Linear Gradient, and Radial Gradient. The Gradient tool is for creating basic gradients. Linear Gradients let you control the shape of the gradient. Radial Gradients let you control the shape of the gradient by the amount of colors you use. See Chapter 8 for more on gradients. **Figure 9-1:** Rotate, translate, and align objects in Photoshop. The Blend Tools group includes five tools: the Dodge and Burn tools.

Send this page to someone via email Alberta will invest \$21 million on technological research and development to explore the potential for carbon dioxide capture and storage (CCS). The government says the support is needed to keep ahead of the science and build a legal path forward to allow for CCS to be economically viable in Alberta. "Technology for carbon capture and storage will be critical as we accelerate towards a low-carbon future, and the market potential of this new technology is huge," said Gov. Iain Black. The province says it will be one of the first jurisdictions in North America to endorse CCS as a greenhouse gas emission-reduction tool, investing in research and development for modern carbon capture, safe transport and storage of the captured carbon. READ MORE: Alberta unveiled new climate change plan Thursday Story continues below advertisement On Thursday, Alberta released its new climate change plan. Premier Jason Kenney said the plan is based on three pillars: economic growth, environmental protection and sustainable development. "Throughout our efforts we have balanced these three pillars, recognizing the need for change, while ensuring our economy and our province continue to grow," Kenney said. Tweet This "Our plan will be implemented in a way that is affordable, by which we mean without sacrificing the quality of life that Albertans now enjoy." The plan covers a wide range of topics, including financial support for municipalities.[Biological internalizations in the biosphere-ecology-behavior studies of mineral waters]. The so-called internalization of the biological activity of mineral waters by experts of the Russian Geographical Society (RGS) and the RGS Baltic-North-Caucasian Regional Centre (RBC) is described in the present paper. It is noted that among the methods for studying internalization of biocatalysts, in Russian scientific literature and in the RBC, experimental tests with complex of living bioinducers as well as with isolated enzymes from various fields of application are in the leading position. There is a wide scope for application of these methods not only in mineral water research but also in a wide range of problems in environmental and biological sciences. A list of some experiences of the RBC on using biological internalization in studying mineral waters is offered.A critical step in the cloning of any intron in the context of a chromosomal megabase has been the identification of the splice donor site at each
