Application of the latest radiopharmaceuticals in oncology: overview and summary of the literature. Imaging is an indispensable tool for oncology. In recent years, positron emission tomography (PET) and single-photon emission computed tomography (SPECT) have become the most important modalities for early disease diagnosis, staging, restaging, monitoring of therapy response, therapy-induced alterations, and disease progression. PET and SPECT allow precise measurements of tumour metabolism, growth, and response to therapy. In oncology, nuclear medicine has found its way to the dominant position. In addition, the invention of new radiopharmaceuticals, e.g. peptides and monoclonal antibodies, was a further development that led to a significant improvement of targeted imaging in oncology. This article presents an overview of the most important radiopharmaceuticals that are applied in oncology.9、1 SMAP 4 40""を、SMAP×SMAP�
