While cleaning one of our own pieces of tapestry this weekend, I noticed a serious inconsistency. There is a weft thread connecting to two warp threads, but it is not connected to two of the three others. I didn't notice it initially as I was looking for an imperfection, which could be located quite easily. However, on closer inspection, this thread is connected between warp threads 1, 3, 4, and 5. But with threads 2 and 6 not connected to any other threads. Is this a flaw in the tapestry, or did it somehow get caught with this piece on its back? A: The reason a weft can be unconnected is because the weft yarn "jumped" - i.e. the weft yarn wrapped

around the warp yarn. When you look at the picture it is clear that this is what happened and it could not happen by itself. The gap you are seeing is actually the end of the previously wrapped weft so you would see the end of the weft as a thin white line. This is not a flaw as per se. Edit: I just realised I was missing the second part of your question, however it is clearly illustrated in the picture - The left portion of the weft is connected to the left warp. A: This is simply an indexing error in the picture.
