Alexa rank Alexa is a website traffic ranking system that ranks websites on a scale of 0 to 10. Technorati Technorati is a website traffic ranking system owned by Microsoft that ranks websites by popularity. Majestic SEO Majestic SEO is another website traffic ranking system owned by Alexa that ranks websites on a scale of 0 to 10. Wired Rank Wired Rank is another website traffic ranking system owned by Alexa that ranks websites on a scale of 0 to 10. ComScore ComScore is a website traffic ranking system owned by ComScore that ranks websites on a scale of 0 to 10. VideoRankings VideoRankings is a website traffic ranking system owned by Alexa that ranks websites on a scale of 0 to 10. Topsy Topsy is a website traffic ranking system owned by Alexa that ranks websites on a scale of 0 to 10. Q: Assumptions about measurement errors on estimated equations I am currently working on a problem where I have to estimate the parameters of a linear regression model. The underlying model is: $y_i = \beta_0 + \beta_1 x_i + \epsilon_i$ where y_i , x_i and ϵ_i are the predicted, actual, and residual of the i th data point respectively. I am given an equation of the form: $y_i = \mu_0 + \mu_1 x_i + \epsilon_i$ in which the ϵ_i 's are also assumed to be normally distributed (uncorrelated) and can be measured with a little error. My question is: Assuming that the error terms are not correlated (even if i was given the error terms are uncorrelated), how does the error in the regression model change? Thanks A: Looking at the same Wikipedia page that Greenstein gives for measuring errors: In statistical regression, the nominal value of the regression is a function of a predictor variable, x_i . Suppose that, although the true value is denoted by a subscript of i , an observed value is denoted by the superscript j , where $j = 1, 2, \dots, n$. The squared error is $\epsilon_j^2 = (\mu_0 - y_j + \beta_1 x_j)^2$
