ImageMagick is a free command-line application that reads and writes JPEG, TIFF, and other format image files. It supports a wide range of input devices, including scanners, digital cameras, and video cameras. It also provides tools for converting, resizing, and manipulating images. The ARRIRAW file format is a raw format created by ARRI, a camera manufacturer based in Munich, Germany. ARRIRAW is a file format that can store a TIFF with up to 2,074 megapixels of data. If an image in that size is saved as an ARRIRAW, then it will be stored in a compressed.arw file. The High Dynamic Range (HDR) format, also called extended dynamic range (EDR), is a 3D imaging file format from Panasonic. The file stores 3D geometry information in a standard TIFF file format, such as 8-bit RGB or 16-bit RGB/RGBA. HDR images were introduced in 2013 and are intended to record the full color gamut of a scene, rather than a single output level. To do this, the camera takes several exposures and combines them together to produce a single image with more fidelity. To ensure that all of the colors are visible, the camera must create a new exposure for each of the colors. No current photographs have ever completely captured the full range of color tones a human being sees, but HDR technology stores those additional tones. Although colors may appear artificial, HDR makes correct colors possible. Other image file formats also exist and are used by photographers and graphic designers. TIFF, along with other file formats such as JPG and GIF, are available for digital cameras. TIFF is available for both RAW and JPEG files. TIFF is useful for photographers who want to print their pictures with high-quality images, but because it stores so much data, it is not feasible to make it readable for other users. This list is far from exhaustive but gives you an idea of the format options available to you. The organization also depends on which books are available in your area or which editors are most convenient to you. You can learn a great deal

more about reading, editing, and manipulating images, along with the various file formats that exist for them, in Chapter 14.

Q: When is a topical thread reopened? My first question on SO was greeted with: This question has been flagged as off-topic because the question body does not contain a question mark or a succinct phrase that indicates this is the problem that the asker is trying to solve. On my next post I asked a question that was then politely closed. (I'm a new user and always try to ask good questions). I thought that might have been the end of the story so was somewhat shocked to find a message in my inbox: This question was removed due to being off-topic. However, the content is still available via the Wayback machine. Is there some reason why it can't be reopened? A: It's on the Wayback Machine. I'm also unable to see why it would need to be deleted in the first place. Was it closed for other reasons? That said, the answer in this case is: It depends. If the question was closed for other reasons, they're closed now, and the question isn't likely to be re-opened. If the question was closed for not containing the pertinent question, I would say the chances of it being re-opened are fairly low. I'm not one for more questions being closed, but I can't fault SO for not wanting to close questions that don't contain a question in the first place.

The role of the flavodoxin gene (*fldA*) in the phototropic behavior of the filamentous cyanobacterium *Synechocystis* 6803. Cyanobacteria are widely known for their ability to undergo phototactic swimming. In *Synechocystis* 6803, phototropic behavior relies on the light-induced relocalization of the photosynthetic units to the new side of the cell, resulting in a change of the cell length. In the absence of flavodoxin, this phototactic response is drastically modified. Here, we have shown that, when the *fldA* gene is inactivated, the steady-state concentration of flavodoxin was only 1% of the normal level. Since the flavodoxin-like protein does not increase the length of the cell in the dark, it is possible to conclude that the flavodoxin/flavodoxin reductase pair is responsible for the phototactic behavior of *Synechocystis* 6803. The present invention is
